## 1. GENERAL

---

TQC Sheen Ideal Finish Analysis (IFA) is designed to download logger data to a computer, analyze the data and print reports.

Ideal Finish Analysis allows the user to analyze data from various loggers. A separate module has been developed for each TQC Sheen logger:

- Cure for the TQC Sheen CurveX
- Climate for the TQC Sheen DewCheck
- Thickness for the Defelsko PosiTector 6000
- Gloss for the TQC Sheen Glossmeter

The application can be configured for two different user levels: basic or advanced. In basic mode the user can download data to the computer and print standard reports. The advanced mode in TQC Sheen Ideal Finish Analysis provides users with a tool for customizing the reports generated by the software. Details such as the position of the probes and the shape or size of the measured object, calculation styles, etc. can all be integrated into the report. This allows users to refine the style of reports to meet their own requirements. Users of the advanced mode are considered to have a basic knowledge of Windows®-operated programs. Switch to the advance mode by choosing **System Configuration** from the **Tools** menu.

As the Ideal Finish Analysis software follows the Windows® style, this manual focuses on the actual functions and their options and the role they play in the entire software concept.

## 2. QUICKSTART

### 2.1 Downloading the software

#### Requirements:

- Internet connection

Install the software on the PC you will be using to read measurement data.

To download the software:

- Step 1 Go to [www.industrialphysics.com](http://www.industrialphysics.com)
- Step 2 Go to a CurveX product page
- Step 3 Click Access Ideal Finish software here:  
<https://industrialphysics.com/software-uploads/TQC-Ideal-Finish-Analysis-Setup-8.0.138.0.exe.zip>
- Step 4 Select the download folder
- Step 5 Click on the exe file to install the software

### 2.2. Installation

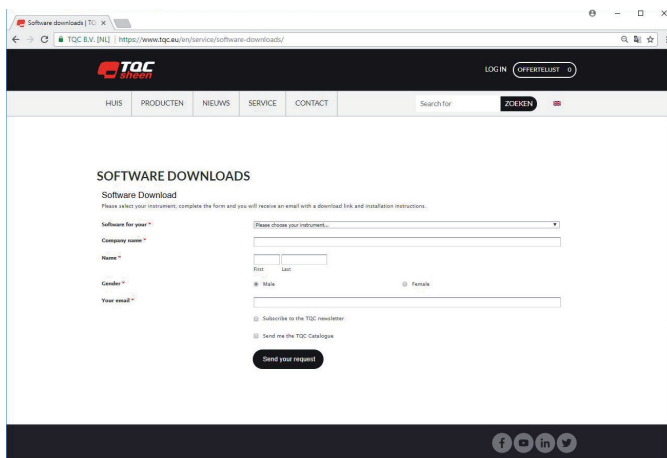

This chapter explains how to install TQC Sheen Ideal Finish Analysis on a computer\*

#### 2.2.1 Install on Windows pc

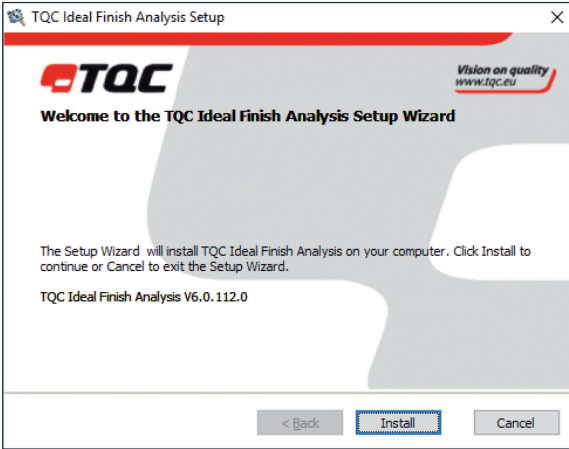

Download TQC.Ideal.Finish.Analysis.Setup.6.0.112.exe (or higher) from the TQC Sheen website at: <https://www.tqc.eu/en/service/software-downloads/>

Once the installer is started dialog1 will be displayed with the Welcome to the Ideal Finish Analysis dialog.

\* Ideal Finish is Windows based software and will not natively run on a Mac. In order to use Ideal Finish on a Mac you will need to install a virtual Windows operating system on the Mac. See 2.2.2.

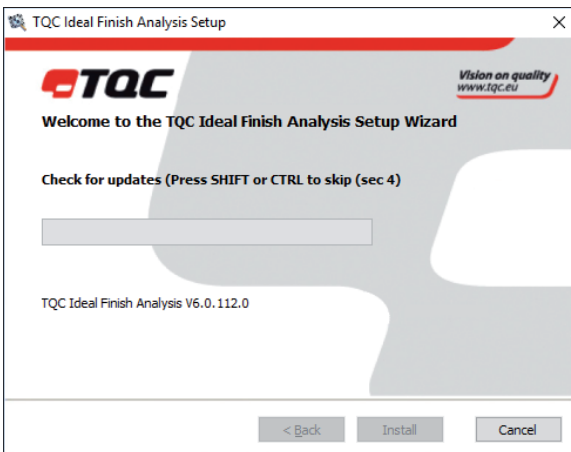

The screenshot shows a web browser window displaying the TQC Sheen website. The page title is "SOFTWARE DOWNLOADS" and the sub-heading is "Software Download". Below the heading, there is a form for requesting software. The form includes fields for "Software for year", "Company name", "Name", "First" and "Last" (with a dropdown for "First"), "Gender" (with radio buttons for "Male" and "Female"), and "Your email". There are also checkboxes for "Subscribe to the TQC newsletter" and "Send me the TQC Catalogue". A "Send your request" button is at the bottom of the form. The website header includes navigation links for "HUIS", "PRODUCTEN", "NIEUWS", "SERVICE", and "CONTACT", along with a search bar and a "ZOEKEN" button. The footer contains social media icons for Facebook, Twitter, and LinkedIn.

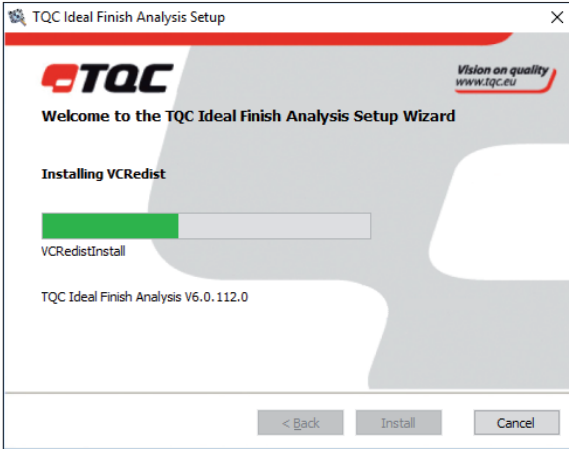

In dialog 1a click Install to continue the installation.

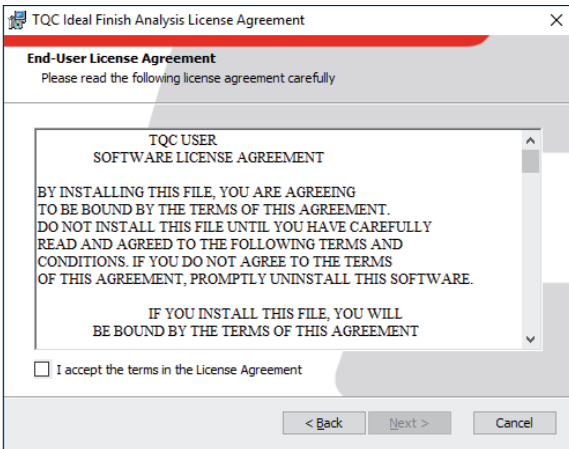

Dialog 1a

Dialog 1b

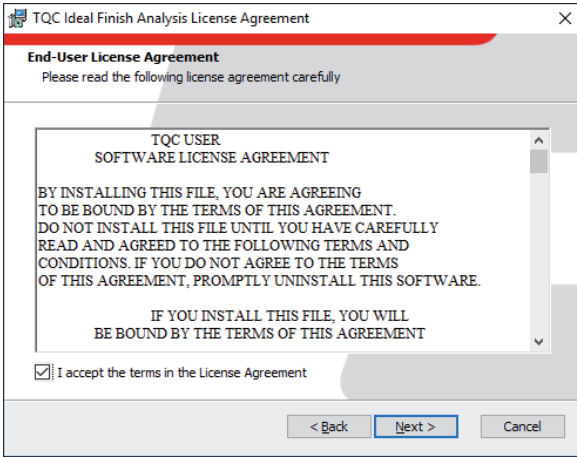

Dialog 1c

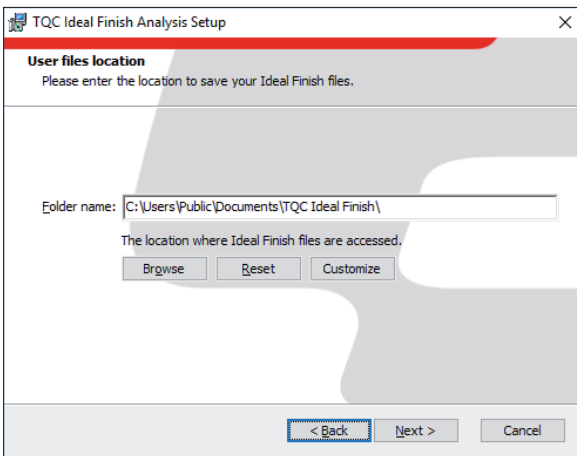

Dialog 2a

To continue the installation please read the license agreement carefully and once done in dialog 2 click the radio button I accept the terms in the License Agreement and click Next.

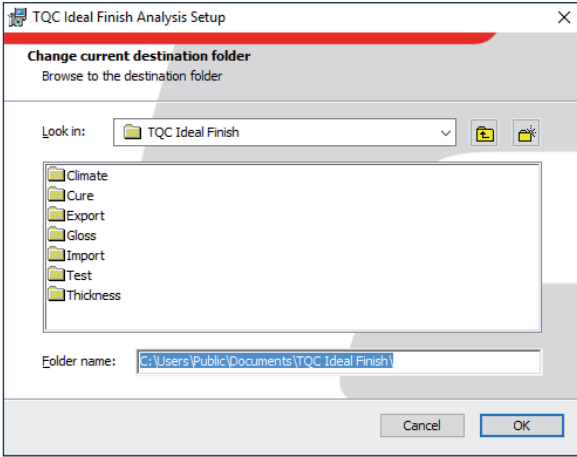

Dialog 2b

Dialog 3

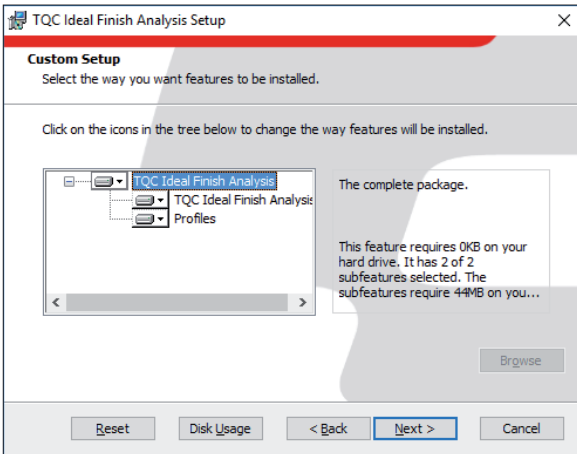

Dialog 3 allows you to specify the installation location of your files. By default it will install in the My Documents folder. A network location can be entered if more people on a workgroup will use TQC Sheen Ideal Finish Analysis. Click Browse to change the location, click Customize to change the programs that will be installed, click Next to continue.

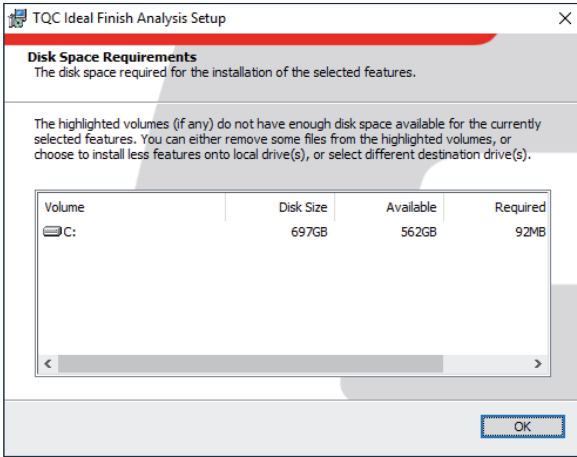

Clicking Browse will show Dialog 4 allowing you to change the destination folder of your user files.

Dialog 4

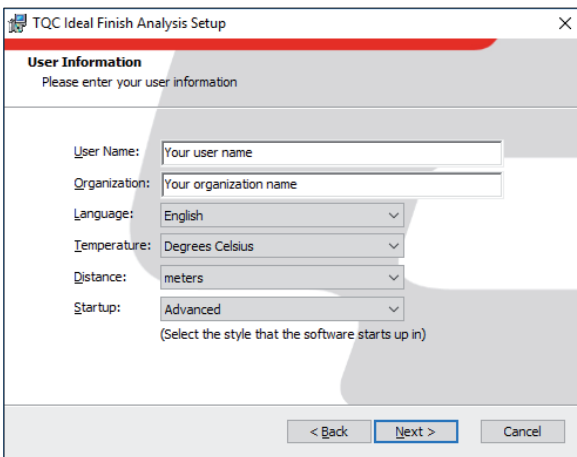

Customize will show Dialog 5 allowing you to change the programs that will be installed. Click Disk Usage to check the required and available disk space, click Next to continue.

Dialog 5

In Dialog 6 the disk usage can be verified, click OK to return to Dialog 5 and continue the installation.

Dialog 6

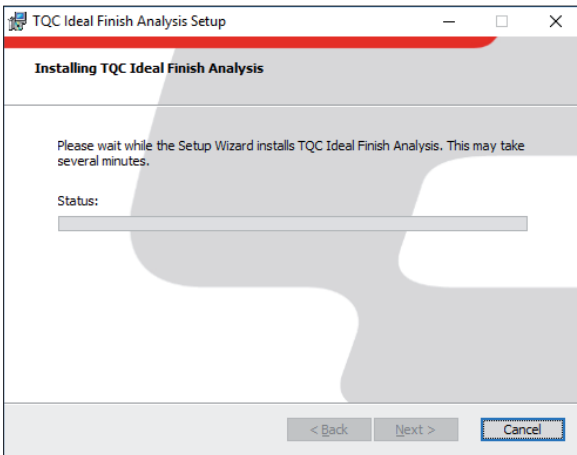

Use Dialog 7 to enter your personal information and preferences. The software will start-up in Advanced mode by default, for less experienced users a basic version is available. It is always possible to alter these parameters later on in the Options menu of TQC Sheen Ideal Finish Analysis.

Dialog 7

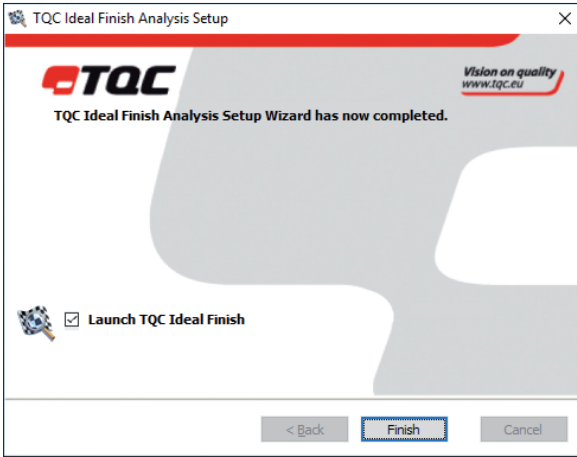

Click Next in Dialog 8 to start the installation.

Dialog 8

Dialog 9 shows the installation process of TQC Sheen Ideal Finish Analysis.

Dialog 9

Dialog 10

Dialog 10 shows the finished installer, click Finish to remove the temporary installation files.

If problems occur and the drivers for the CurveX or Dewcheck are not installed properly they are available from the installation location that was set in Dialog 3. By default you will be able to find them in C:\Program Files\TQC\TQC Ideal Finish V5\

## 2.2.2 How to install Ideal Finish on a Mac

Ideal Finish is Windows based software and will not natively run on a Mac. In order to use Ideal Finish on a Mac you will need to install a virtual Windows operating system on the Mac. There are multiple options available to do this. TQC Sheen tested the operation of Ideal Finish with Parallels (desktop 11). This software can be downloaded from [www.parallels.com](http://www.parallels.com).

### What gauges can be connected to the Mac:

- TQC Sheen CurveX 3
- TQC Sheen Gloss meter
- TQC Sheen Equipment launched 2016 or later

### What should you have available:

- A Mac suitable for running Parallels (please check [www.parallels.com](http://www.parallels.com))
- License for Parallels
- License for Windows 8 or higher
- Approximately 50Gb free memory on the Mac

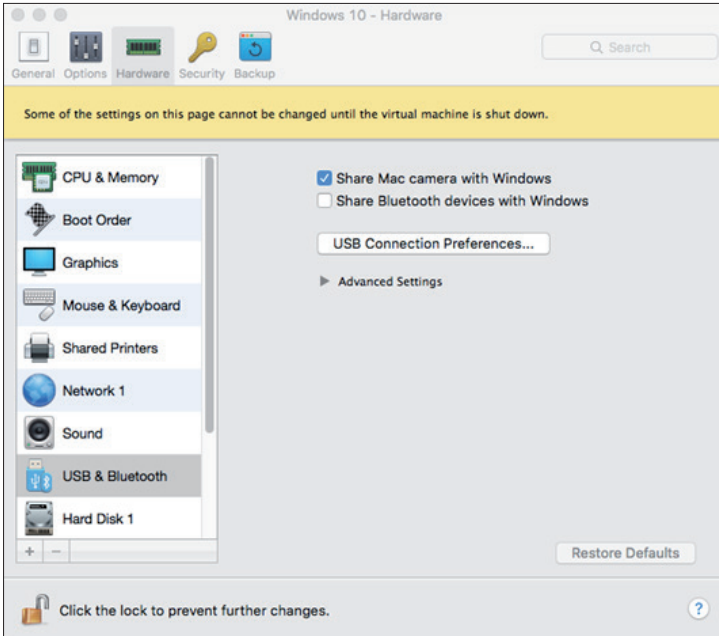

### How to install Ideal Finish

Install Parallels as per manual of Parallels.

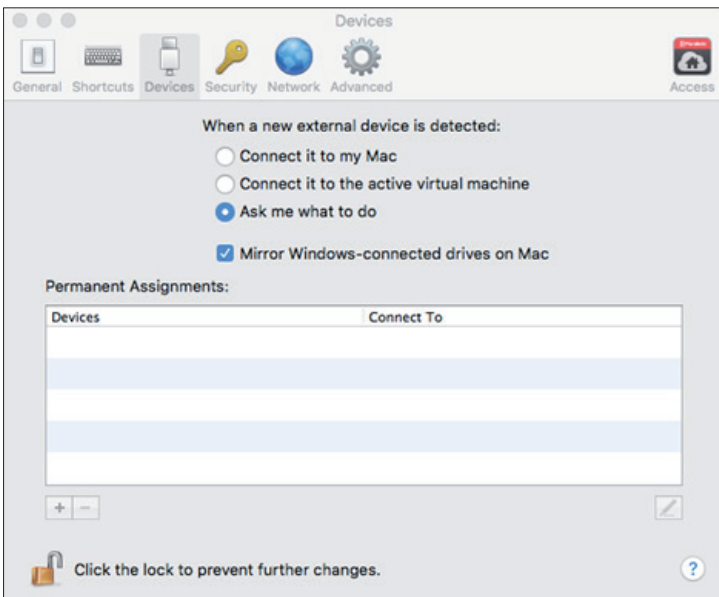

Install Windows within Parallels

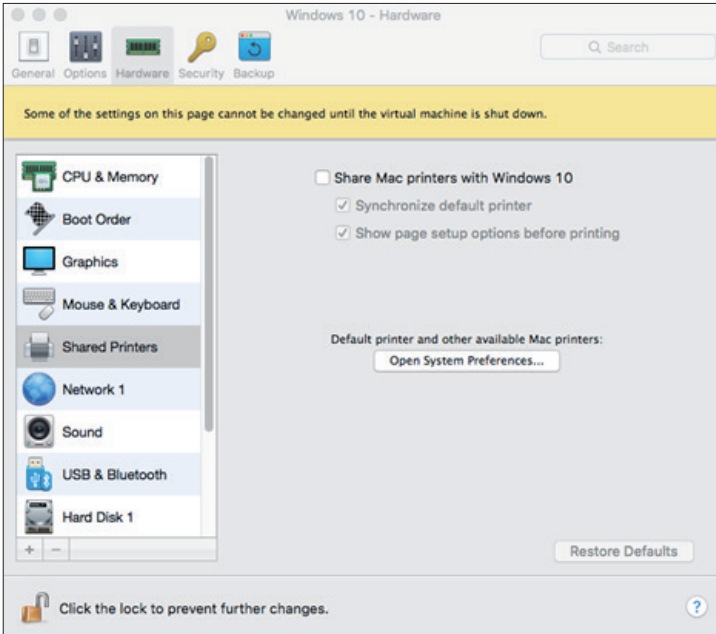

In the main screen of Parallels select the setting wheel (second icon bottom row)

In the Settings menu select Hardware-> USB & Bluetooth -> USB Connection Preferences

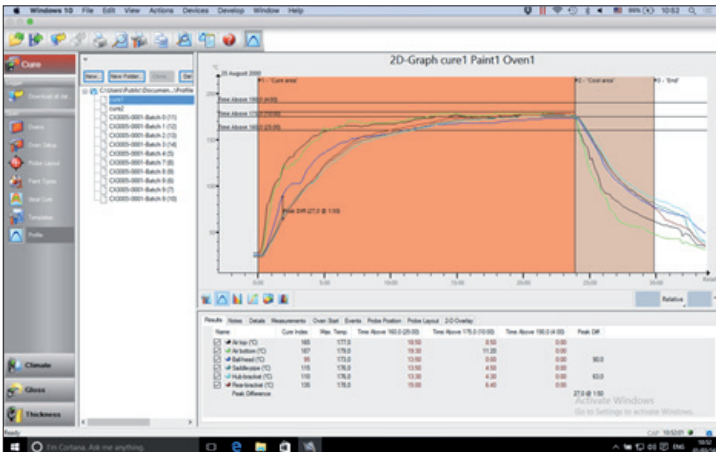

In this screen select [Ask me what to do] and close this screen.

Select Shared Printers and allow Mac printers to be shared with Windows.

Select Network and source shared network to allow windows to connect to the same WiFi network as the Mac

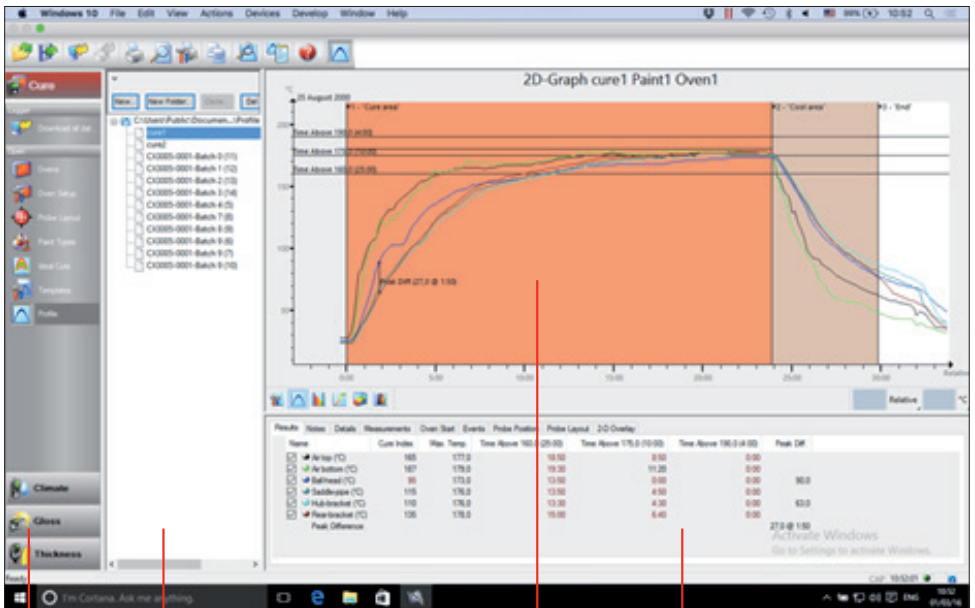

Now open Windows on the Mac and Install Ideal Finish as if it was a Windows machine (See 2.2.1). Follow Ideal Finish instructions.

### 3 TQC SHEEN IDEAL FINISH ANALYSIS - THE SOFTWARE

This user-friendly software is designed to evaluate and analyze the data collected by your instrument data logger. The Ideal Finish software can be used in two modes: basic and advanced. In basic mode, the software allows you to define a paint type and view temperature profiles.

TQC Sheen Ideal Finish Analysis is easy to use because its graphical user interface is based on standard Windows terminology and standard Microsoft terms. As a result, features such as printing and print previews are the same as in other standard Windows products (such as Microsoft Word). Please note that some of the dialog boxes will appear in the language of the version of Windows that is currently installed.

Screen 2.

- 1
- 2
- 3
- 4

1. Short cut menu
2. File explorer
3. Graph
4. Data view

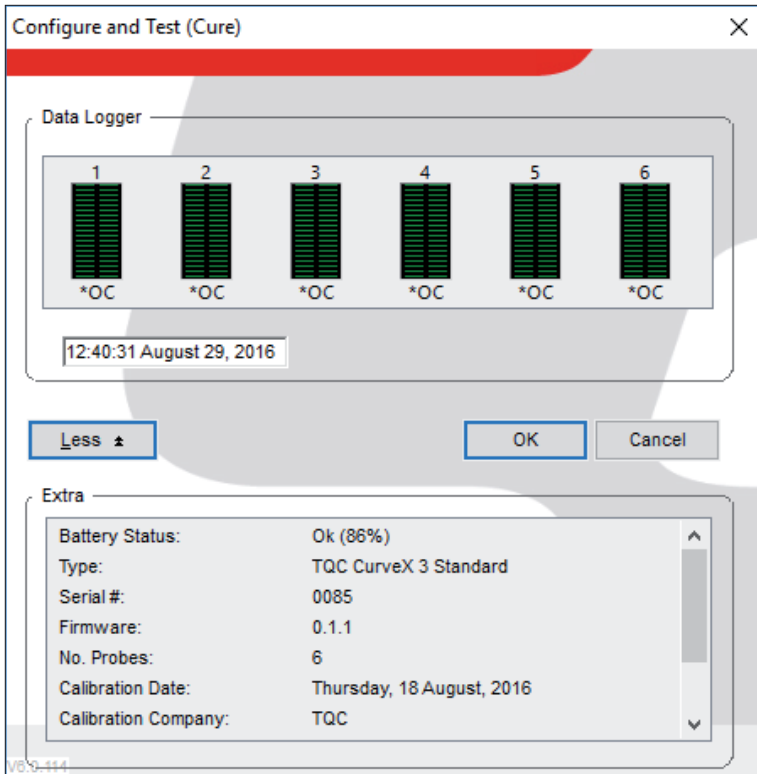

### 3.1 Configuring and testing communication

In order for the data logger to communicate with a Pc, use the cable to connect it to an available communication port on the Pc. once connected, communication can be tested by taking the following steps.

- Step 1.** Choose **Configure & Test...** from the **Logger** menu.
- Step 2.** Choose the communication port to which you have connected your data logger.
- Step 3.** Click **Test**. the serial number and battery status should appear. if not, check the communication port, battery, cable and/or Pc settings.
- Step 4.** Press **Start** to check the probes. the probes should now give ambient temperature readings.

Screen 3.

If the correct COM Port has been selected, the serial number and the battery status of the data logger are displayed. If an error message is displayed, switch to another COM Port. If all COM Ports display an error message, make sure that the batteries are charged and the data logger is set to ON. Also check whether the data logger is connected to the PC and check whether the COM Port on the PC is free for use.

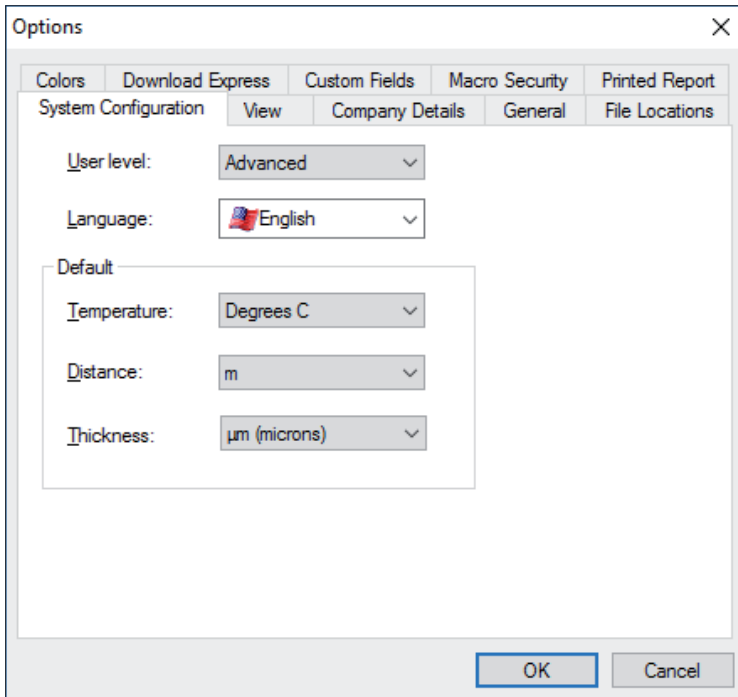

### 3.2 System configuration

choose options... from the tools menu to define your preferences.

#### 3.2.1 System configuration

- Step 1.** Change the user level to Advanced so that you can use all the features in TQC sheen Ideal Finish Analysis.
- Step 2.** Select your Language.
- Step 3.** Select the Temperature units.
- Step 4.** Select the Distance units.
- Step 5.** Select the Thickness units

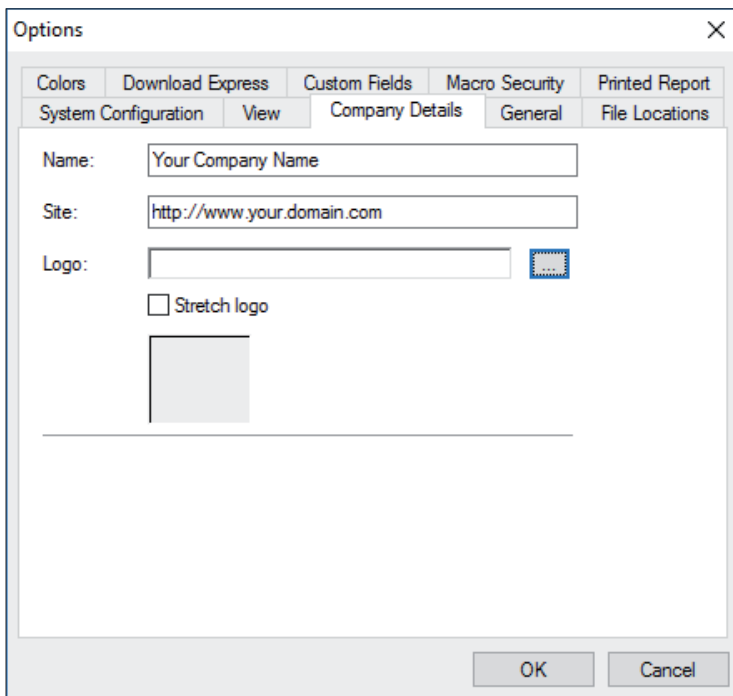

Screen 4.

### 3.2.2 Company Detail

- Step 8.** Fill in the name, website, address and logo of your company. This information will be used as header information on the reports created by TQC Sheen Ideal Finish Analysis.
- Step 9.** Click the **Download Express** tab.

Screen 5.

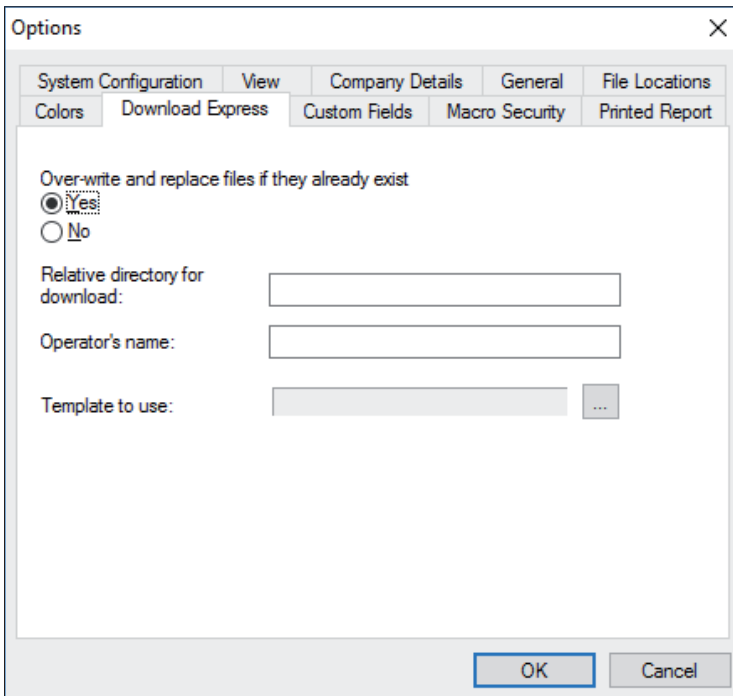

The screenshot shows a dialog box titled "Options" with a close button (X) in the top right corner. The dialog has several tabs: "Colors", "Download Express", "Custom Fields", "Macro Security", "Printed Report", "System Configuration", "View", "Company Details", "General", and "File Locations". The "Company Details" tab is currently selected. Inside this tab, there are three text input fields: "Name:" with the placeholder text "Your Company Name", "Site:" with the placeholder text "http://www.your.domain.com", and "Logo:" with an empty field and a small blue icon to its right. Below the "Logo:" field is a checkbox labeled "Stretch logo" which is currently unchecked. At the bottom of the dialog, there are two buttons: "OK" and "Cancel".

### 3.2.3 Download Express

TQC Sheen Ideal Finish Analysis can speed up the printing of a report at the click of a single button. Switch TQC Sheen Ideal Finish Analysis to advanced mode to enable your line operators to print a report based on a template for specific processes.

- Step 10.** Select **Overwrite and replace files if they already exist** to replace files already downloaded from the logger.
- Step 11.** Files will be automatically downloaded to the folder where profiles are located. Change the relative directory to download files to a different location.
- Step 12.** Enter the operator name to be placed on the report.
- Step 13.** Select the template to use for downloads.
- Step 14.** Click **OK** to save the changes.

Screen 6.

The screenshot shows a dialog box titled "Options" with a close button (X) in the top right corner. The dialog has several tabs: "System Configuration", "View", "Company Details", "General", "File Locations", "Colors", "Download Express" (which is selected), "Custom Fields", "Macro Security", and "Printed Report".

Under the "Download Express" tab, there is a section titled "Over-write and replace files if they already exist" with two radio buttons: "Yes" (which is selected) and "No".

Below this are three input fields:

- "Relative directory for download:" with an empty text box.
- "Operator's name:" with an empty text box.
- "Template to use:" with a greyed-out text box and a small button with three dots (a file selector).

At the bottom of the dialog are two buttons: "OK" and "Cancel".

## 4 TQC SHEEN IDEAL FINISH ANALYSIS – BASIC MODE

---

To make full use of the analysis software, follow all the steps in this chapter. Refer to screen 2 for the main control areas. The Shortcuts menu contains tips on easy access to the various options in TQC Sheen Ideal Finish Analysis.

### 4.1 Setting up your instrument

Every time before you start temperature logging, you must first define the sample rate and paint types. After you define the interval time, the temperature scale (Centigrade / Fahrenheit), the date and time are also specified.

**N.B.** The system uses the data logger's ID and batch number to generate a unique profile name. If a profile with that name already exists on disk, it is assumed that the user does NOT want to download (and overwrite) this profile. In addition, the system adds the recently downloaded files to its downloaded file list in the File Explorer.

**N.B.** *The system automatically adds 'time above' values to the Result screen for the paint type defined at reset.*

#### 4.1.1 Specifying the interval time (step 1 of 7)

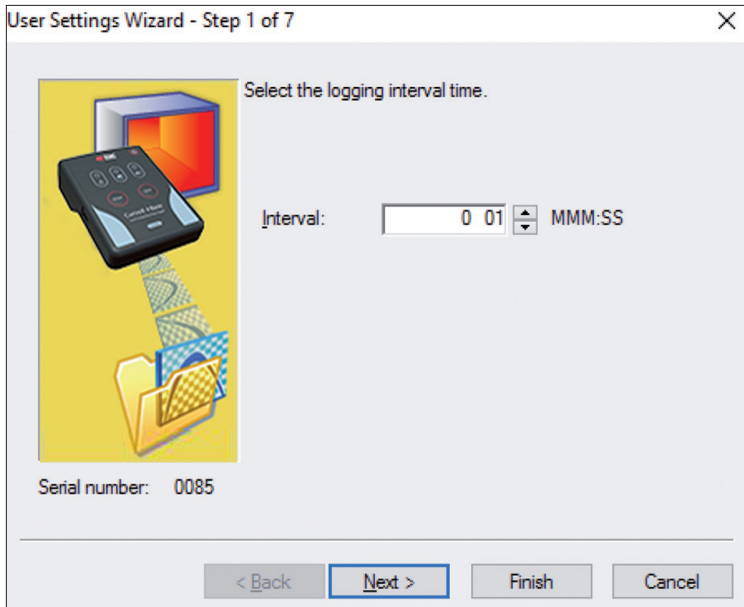

**Step 1.** Choose User settings... from the logger menu.

**Step 2.** Change the interval time, the time between measurements.

When you increase this value, you increase the data logging time for one block of memory

**Step 3.** Click Next.

Screen 7.

#### 4.1.2 Specifying the units and synchronize PC time (step 2 of 7)

**Step 4.** Select the display units

**Step 5.** Check the synchronize check box. This will set the data logger time to the Pc time.

**Step 6.** Click Next.

Screen 8.

User Settings Wizard - Step 2 of 7

Select the display units and synchronize the logger time with your PC clock

Display units: Centgrade

Date/Time

System/PC: Monday, 29 August, 2016 13:21:21

Logger: Monday, 29 August, 2016 13:21:21

Synchronize

Serial number: 0085

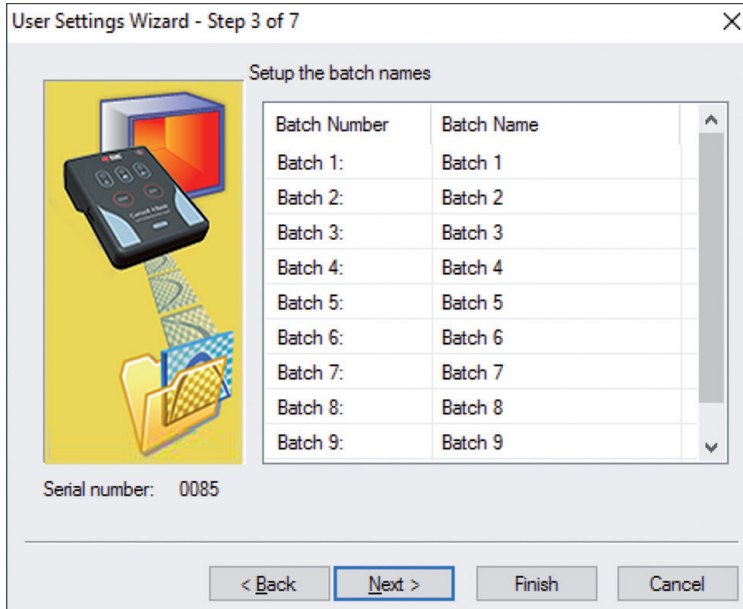

< Back   Next >   Finish   Cancel

### 4.1.3 Specifying the batch names (step 3 of 7)

**Step 7.** Specify the name for each group of measurements

**Step 8.** Click Next.

Screen 9.

The dialog, depending on the instrument, will display the amount of batches (groups of measurements) and allow you to specify a name for each group.

#### 4.1.4 Specifying the START/STOP time and temperature (step 4 of 7)

in this step in the user settings Wizard, you can define a start and stop temperature or time. only the values are defined here; you must make the actual start on the logger.

**Step 9.** If desired, click Enabled and define the start and stop temperatures.

**Step 10.** If desired, click Enabled and define the start and stop time.

**Step 11.** Click Next.

Screen 10.

User Settings Wizard - Step 4 of 7

Switch on the logger start at time mode and set the start and stop time

Serial number: 0085

**Temperatures**

Enabled

Start: 60°C

Stop: 100°C

**Time**

Enabled

Start: 29-Aug-16 13:24:47

Stop: 29-Aug-16 15:46:01

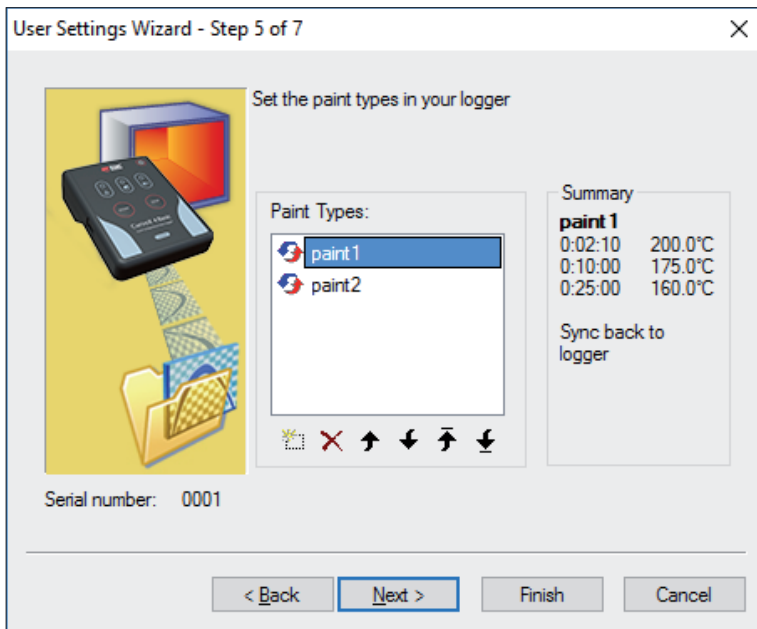

< Back Next > Finish Cancel

#### 4.1.5 Specifying the cure specifications (step 5 of 7)

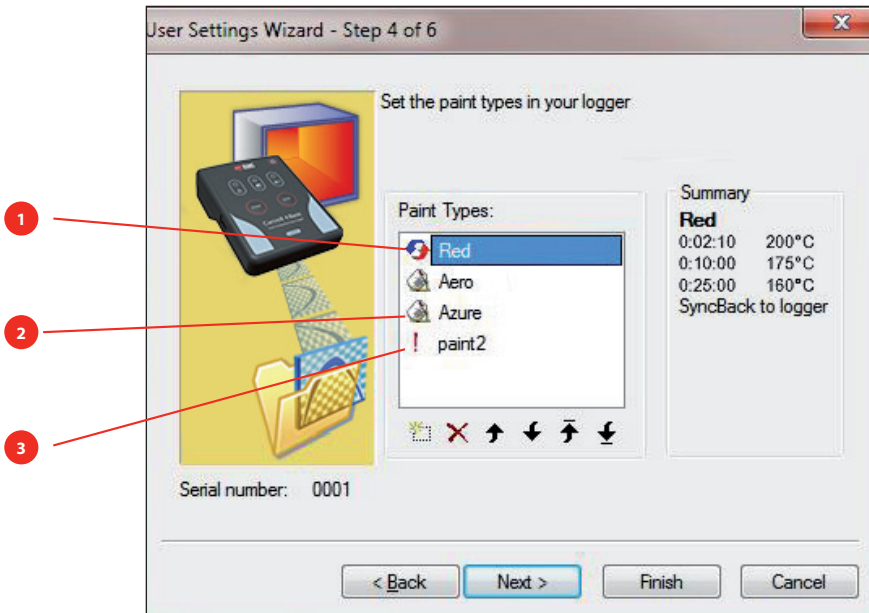

In this step in the User Settings Wizard, you can add paint types to the instruments. The type of instrument defines the maximum number of paint types that can be stored on the instrument. The paint types are listed in the Paint types window, where a summary of the selected paint type is displayed on the right.

- Step 12. Click the Open File button (  ) to view the available paint types and add the required type. Do this for each individual paint type.
- Step 13. Use the move up/DoWn or Delete buttons to complete the list.
- Step 14. Click Next.

Screen 11.

Screen 12.

## Legend

1. Has been sent from this PC for this serialnumber to the logger, but needs to be resynched as the logger one has changed.
2. Has never been sent from this PC for this serialnumber, so just leave it alone.
3. This paint type is corrupted.

#### 4.1.6 Selecting the cure specification active paint type (step 6 of 7)

Once the paint types have been added to the paint library, you need to select the paint type to be used to calculate the cure index on the instrument. The default paint type is the type currently active on the instrument.

**Step 15.** If a paint type other than the current type is to be used, click the arrow to the right of the list box to display the added paint types. select the paint type required for the next cure index calculation, and then click Finish.

**Step 16.** If the current cure specification is to be used, click Next.

Screen 13.

User Settings Wizard - Step 6 of 7

Set the cure specifications that will be printed on the report.

Cure specification: paint 1

	Time	Temperature
Cure Spec 1:	2: 10	200°C
Cure Spec 2:	10: 00	175°C
Cure Spec 3:	25: 00	160°C

Serial number: 0085

< Back   Next >   Finish   Cancel

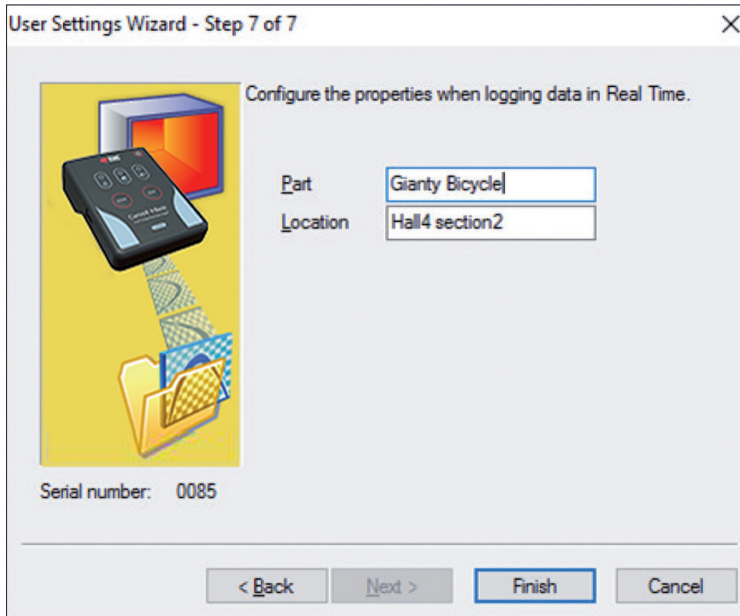

#### 4.1.7 Selecting the active paint type (step 7 of 7)

Some extra information about the operator and location can be added to this instrument when used in real time recording mode.

**Step 17.** Enter the part information.

**Step 18.** Enter the location information.

Screen 14.

User Settings Wizard - Step 7 of 7

Configure the properties when logging data in Real Time.

Part: Gianty Bicycle

Location: Hall4 section2

Serial number: 0085

< Back   Next >   Finish   Cancel

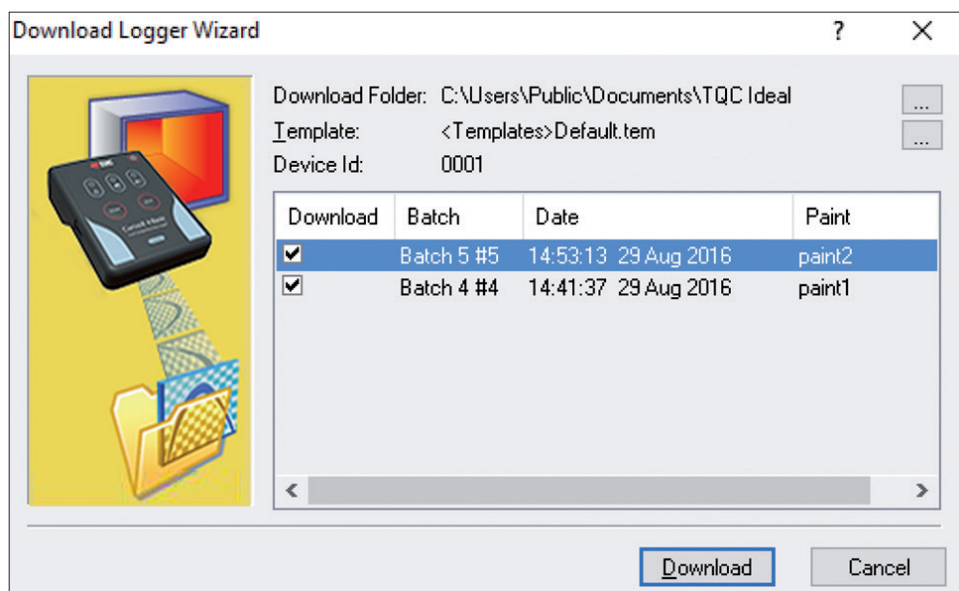

## 4.2 Downloading data

### 4.2.1 Selecting download batches

After data has been recorded, it is downloaded to the PC with the **Download Logger Wizard**. To do this, take the following steps:

- Step 1.** Choose **Download all data to PC...** from the **Logger** menu.
- Step 2.** Specify the location to which the batches must be downloaded.
- Step 3.** Download all batches (default) or remove batches from the download list by checking the checkbox.
- Step 4.** Click **Download**.

Screen 15.

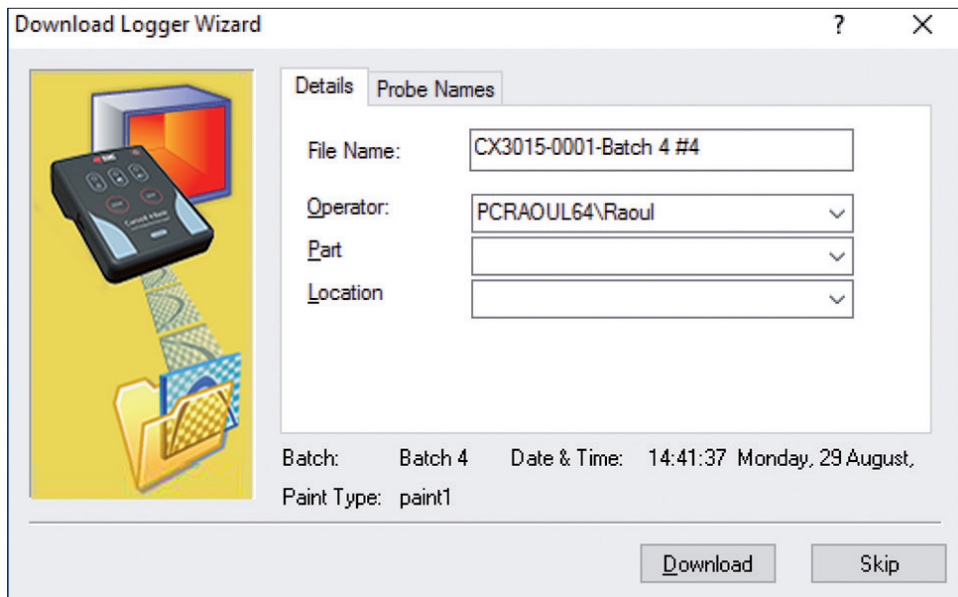

## 4.2.2 Specifying environment details

**Step 5.** Choose the **Operator**, part and location.

**Step 6.** Click the **Probe Names** tab.

Screen 16.

The screenshot shows a Windows-style dialog box titled "Download Logger Wizard" with a help icon (?) and a close icon (X) in the top right corner. The dialog has two tabs: "Details" and "Probe Names", with "Probe Names" selected. On the left side, there is a graphic showing a handheld device connected to a computer monitor, with a folder icon below it. The main area contains the following fields:

- File Name:** CX3015-0001-Batch 4 #4
- Operator:** PCRAOUL64\Raoul (dropdown menu)
- Part:** (empty dropdown menu)
- Location:** (empty dropdown menu)

Below the fields, the following information is displayed:

Batch: Batch 4      Date & Time: 14:41:37 Monday, 29 August,  
Paint Type: paint1

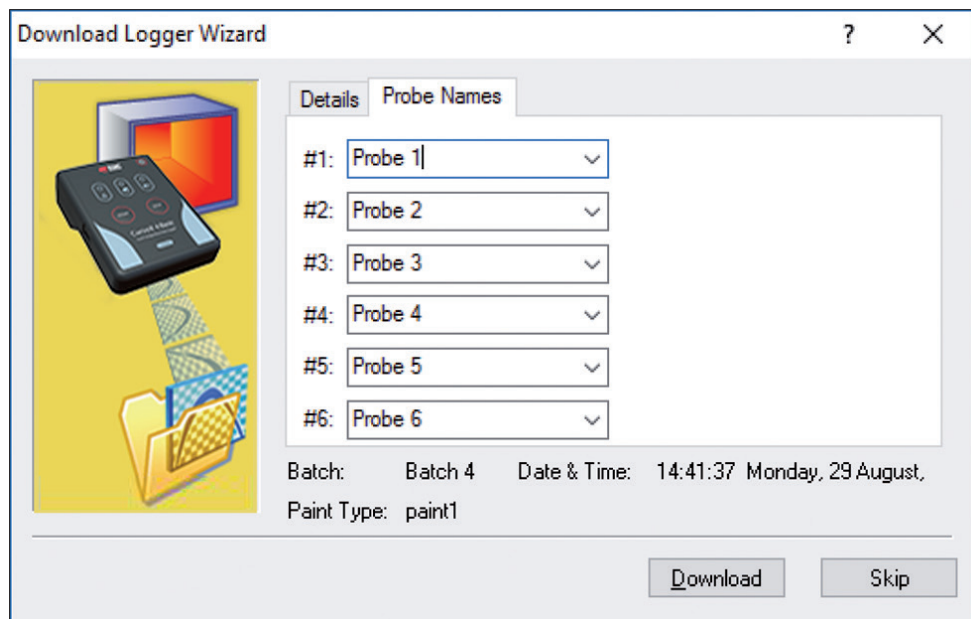

At the bottom right, there are two buttons: "Download" and "Skip".

### 4.2.3 Specifying probe names

**Step 7.** Choose the probe names - for example, air-probe, top-probe

**Step 8.** Click **Download** for each batch to be downloaded. Click **Skip** to cancel the batch download.

Screen 17.

### 4.3 Setting up a paint type

You can define and add default paint types for general or future use. Once a paint type has been defined, it can be linked to a batch with data at any time to create a profile. Two default sample paint types have already been installed:

- Paint1: a yellow paint that cures between 160°C and 200°C.
- Paint2: a clear coat paint that cures between 120°C and 160°C.

These paints are used in oven1 and oven2 and have corresponding profiles: profile1 and profile2.

#### 4.3.1 Adding a new paint type

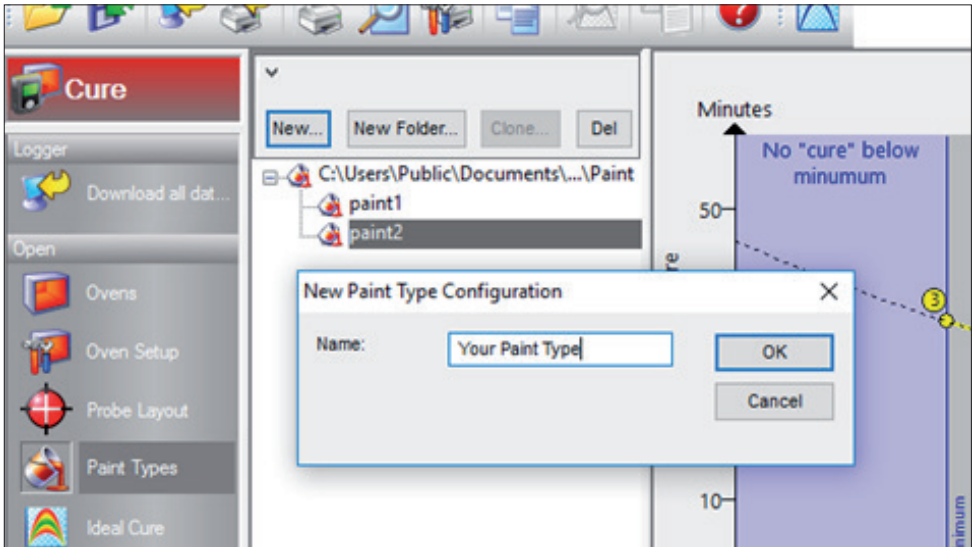

**Step 1.** Click the **Paint-Types** icon in the **Shortcuts** menu.

**Step 2.** Click the **New** button to start a new paint type.

**Step 3.** Enter the name of the paint type to be used.

**Step 4.** Click **OK** and then **Save** in the "Save as" dialog box. The "Save as" dialog box, which is not displayed here, is a standard windows dialog box that appears after you click **OK**.

Screen 18.

### 4.3.2 Defining general paint information

After you have added the new paint type, you can define general cure information for this paint type. This information will be used by TQC Sheen Ideal Finish Analysis to analyze all the measured data and calculate new views for a better cure. The paint manufacturer usually supplies this information together with the paint.

- Step 5.** Select the **Units** measure in degrees Celsius or Fahrenheit.
- Step 6.** Define the **Maximum** and **Minimum** cure boundaries for the paint type. This is usually the highest and lowest value of the paint cure specification. The cure is calculated from the **Min** to the **Max** value. The curve outside these boundaries remains unused.
- Step 7.** Define the **Number of points** for the cure rate curve, this defines the number of point available on the Cure Parameters Tab.
- Step 8.** Select a cure characteristic **Style**:
- Standard (Exponential)  
Most commonly used and most accurate cure calculation method according to a curved line.
  - Linear  
Cure calculation according to a straight line.
- Step 9.** Define the Number of points for the Time above constraints, this defines the number of points available on the Constraints Tab. Check the box for Minimum and Maximum constraint to add these two cure parameter as curing constraint.

Screen 19.

The screenshot displays the 'Cure Parameters' tab of a software interface. It is divided into several sections:

- Temperature:** Features a 'Units' dropdown menu set to 'Degrees C'. Below it are two input fields: 'Max cure temp' with a value of '250.0°C' and 'Min cure temp' with a value of '50.0°C'. A blue circular icon is located to the right of these fields.
- Max display time above:** A single input field containing the value '60'.
- Cure characteristics:** Contains a 'Number of points' input field with the value '8' and a 'Style' dropdown menu set to 'Exponential (Standard)'. A small blue icon is positioned to the right of the 'Number of points' field.
- Time above constraints:** Includes a 'Number of points' input field with the value '2' and two checkboxes: 'Include Min as constraint' and 'Include Max as constraint', both of which are currently unchecked.

### 4.3.3 Defining cure parameters

**Step 9.** Click the Cure Parameters tab.

**Step 10.** You can select the time-temperature pairs (points) by changing the Id or clicking directly on the points with a mouse. The number of points was defined in Step 7 on the **General** tab.

**Step 11.** Once the Id is selected, the values are changed according to the paint specifications supplied by the manufacturer. After you finish defining the paint type, the program will ask you if you want to save the changes; click **OK**.

In general, the highest and lowest values are defined on the Maximum (red) and Minimum (blue) lines. TQC Sheen Ideal Finish Analysis will always send three points to the instrument:

1. The Maximum value, which is the intersection of the curve with the Maximum (red) line.
2. The Minimum value, which is the intersection of the curve with the Minimum (blue) line.
3. A point in between. The user can indicate multiple points. The point nearest to the middle is used.

Screen 20.

The screenshot shows a software window with three tabs: "General", "Cure Parameters", and "Constraints". The "Cure Parameters" tab is selected. On the left, there is a label "Id:" followed by a dropdown menu. To the right, there is a section titled "Time, temperature pair" which contains two columns. The first column is labeled "Time (HHH:MM:SS)" and has a text box containing "0: 30: 00" with a small up/down arrow on the right. The second column is labeled "Temperature" and has a text box containing "125. 0°C" with a small up/down arrow on the right.

#### 4.4 Viewing temperature profiles

The data batches can be viewed in various formats and analyzed once they have been selected as profiles in the File Explorer area. Follow the steps below to view a batch in the default 2D-Graph.

##### Two sample profiles

The sample profiles with the corresponding ovens and paint types are designed to demonstrate the use of the CurveX data logger in the process of painting a Giant bike yellow. See the **Image** tab in the **Probe Layout**.

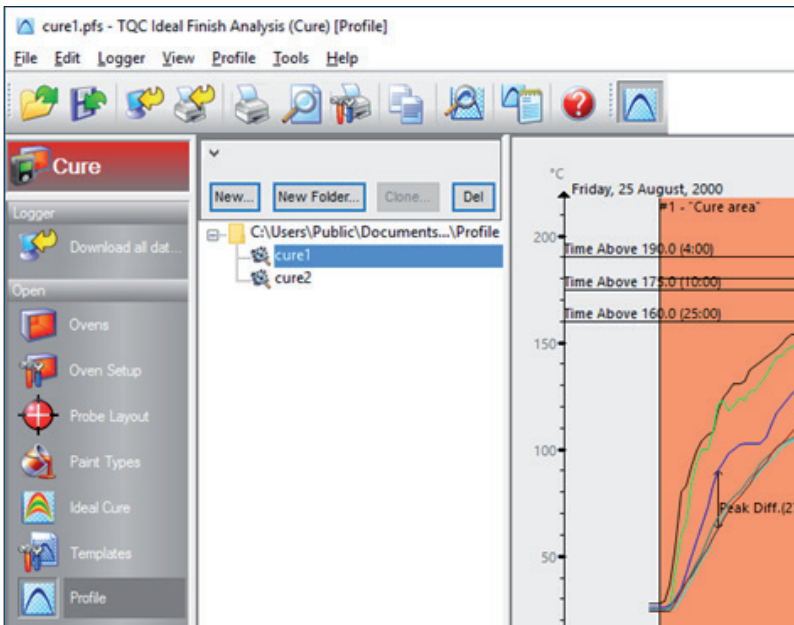

Two default sample profiles have been installed:

- Profile1: a run through oven1 with paint1 (yellow)
- Profile2: a run through oven2 with paint2 (clear coat)

**Step 1.** Click the **Profile** icon in the **Shortcuts** menu.

**Step 2.** Select a batch in the File Explorer.

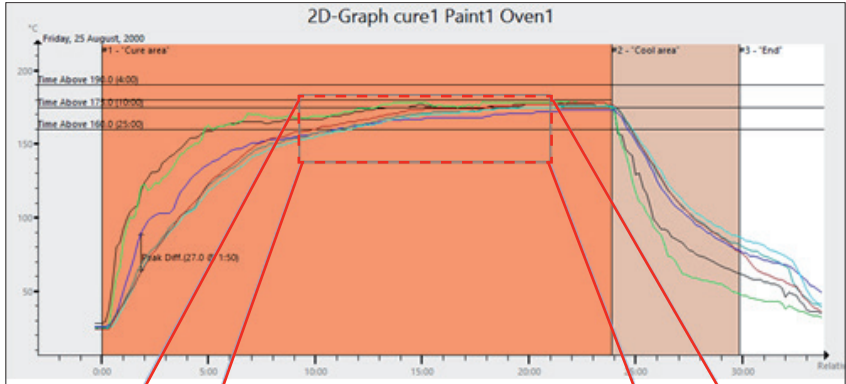

Screen 21.

#### 4.4.1 Zooming in and out on 2D graphs

- Step 1. Click and hold down the left mouse button in the 2D graph.
- Step 2. Drag the mouse pointer to the opposite corner and release the mouse button.

Screen 22.

Zoom area

#### 4.4.2 Analyzing profile data

- Step 1.** Click the **Results** tab to view the batch data in columns.
- Step 2.** Click the **Notes** tab to view, edit or add to your notes.
- Step 3.** Click the **Details** tab to view or change the **Operator** name, **Part** or **Location**.
- Step 4.** Click the **Probe Position** tab to view or change the probe names and colors.

Screen 23.

Results	Notes	Details	Measurements	Oven Start	Events	Probe Position	Probe Layout	2-D Overlay
			<b>Name</b>	<b>Cure Index</b>	<b>Max. Temp.</b>	<b>Time Above 160.0 (25:00)</b>	<b>Time Above 175.0 (10:00)</b>	
<input checked="" type="checkbox"/>			Air top (°C)	165	177.0	18:50	8:50	
<input checked="" type="checkbox"/>			Air bottom (°C)	187	179.0	19:30	11:20	
<input checked="" type="checkbox"/>			Ball-head (°C)	95	173.0	13:50	0:00	
<input checked="" type="checkbox"/>			Saddle-pipe (°C)	115	176.0	13:50	4:50	
<input checked="" type="checkbox"/>			Hub-bracket (°C)	110	176.0	13:30	4:30	
<input checked="" type="checkbox"/>			Rear-bracket (°C)	135	178.0	15:00	6:40	
			Peak Difference					

#### LEGEND

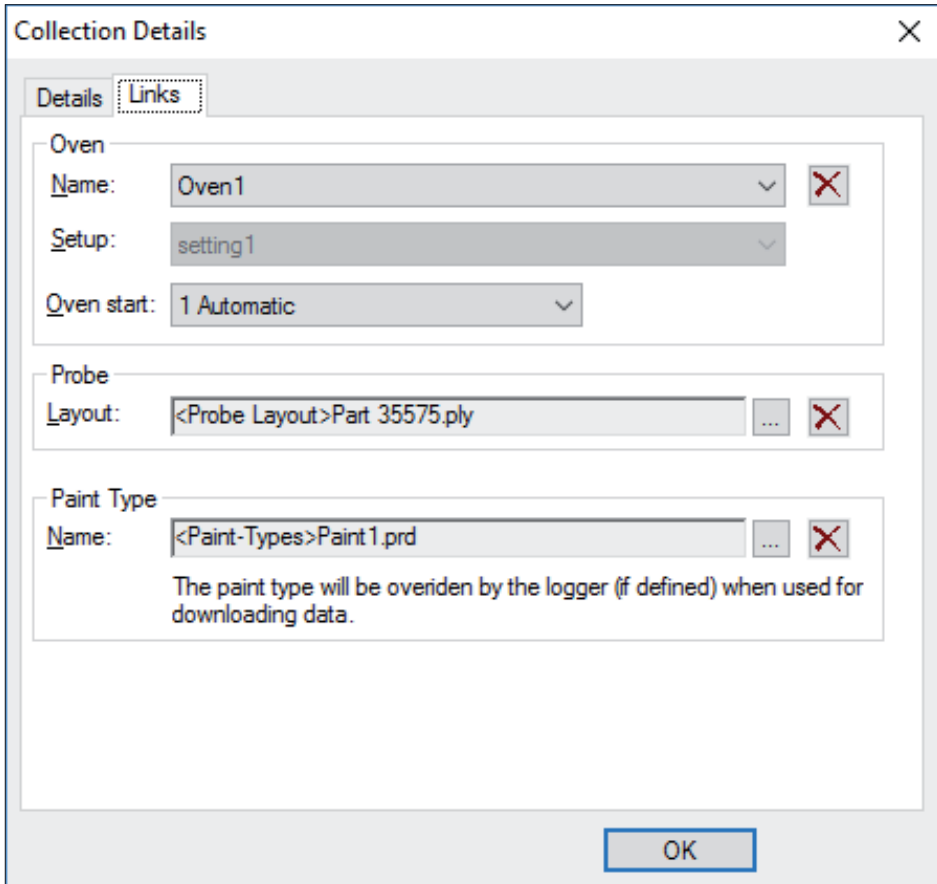

- Name** The probe label name
- Cure Index** A cure index of 100 means perfect process conditions. Values below 100 or much higher than 100 require attention.
- Max.temp.** The maximum temperature reached on this probe during this measurement.
- Time Above...** The time that the temperature exceeded the temperature specified in the Time Above column header.
- Peak Diff** The time during which the biggest difference in temperature occurred.

### 4.4.3 Adjusting collection details

It is possible to view the collection details and define another paint type, if required.

- Step 1.** Choose **Collection Details...** from the **Profile** menu and select the **Links** tab; click **OK**.
- Step 2.** Choose the desired objects you want to link to this particular profile.  
When you select a new paint type, the cure results will be recalculated.

Screen 24.

The screenshot shows a dialog box titled "Collection Details" with a close button (X) in the top right corner. The dialog has two tabs: "Details" and "Links", with "Links" selected. The "Links" tab contains three sections:

- Oven:** A group box containing three fields: "Name:" with a dropdown menu showing "Oven1" and a red X button; "Setup:" with a dropdown menu showing "setting1"; and "Oven start:" with a dropdown menu showing "1 Automatic".
- Probe:** A group box containing one field: "Layout:" with a text box containing "<Probe Layout>Part 35575.ply", a browse button (...), and a red X button.
- Paint Type:** A group box containing one field: "Name:" with a text box containing "<Paint-Types>Paint1.prd", a browse button (...), and a red X button. Below this field is a note: "The paint type will be overiden by the logger (if defined) when used for downloading data."

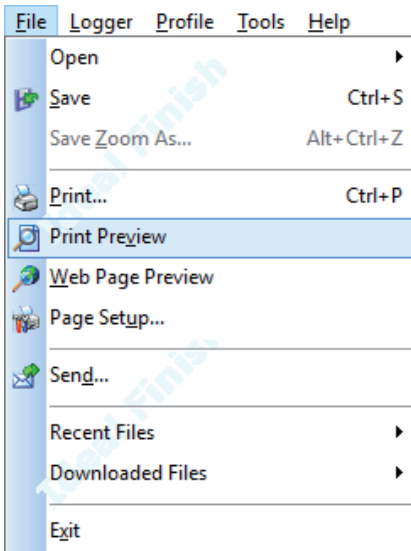

At the bottom of the dialog is an "OK" button.

#### 4.4.4 Printing a paint type or profile data

Once a profile or paint type has been selected in the File Explorer, you can send it to a Printer or an email program.

- Step 1.** Choose **Print** from the **File** menu to send the data to a printer.
- Step 2.** Choose **Send** from the **File** menu to send the report to an email program.

Screen 25.

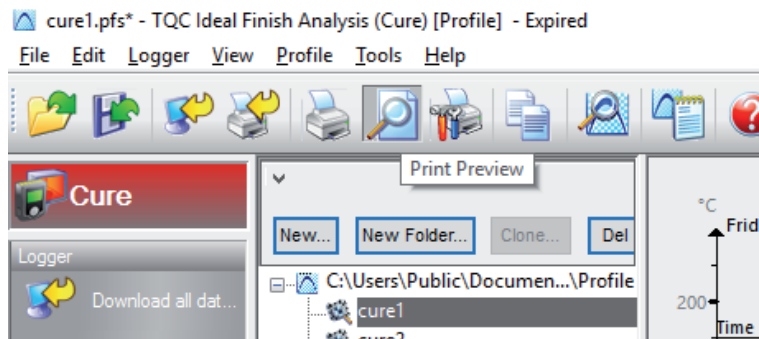

#### 4.4.5 Preview profile data

Use the Print Preview option from the File menu or toolbar to view the report.

Screen 26.

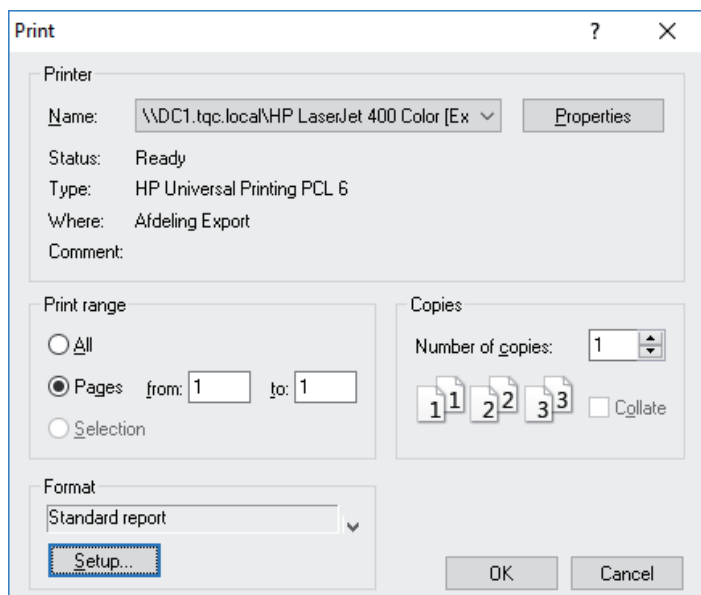

#### 4.4.6 Print format setup

Use the format setup options to tailor printed report properties to your needs.

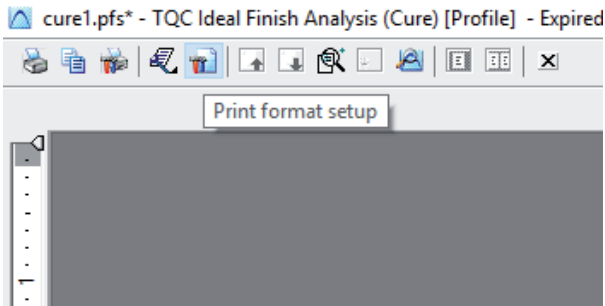

From the File menu select Print... followed by Setup...

Screen 27.

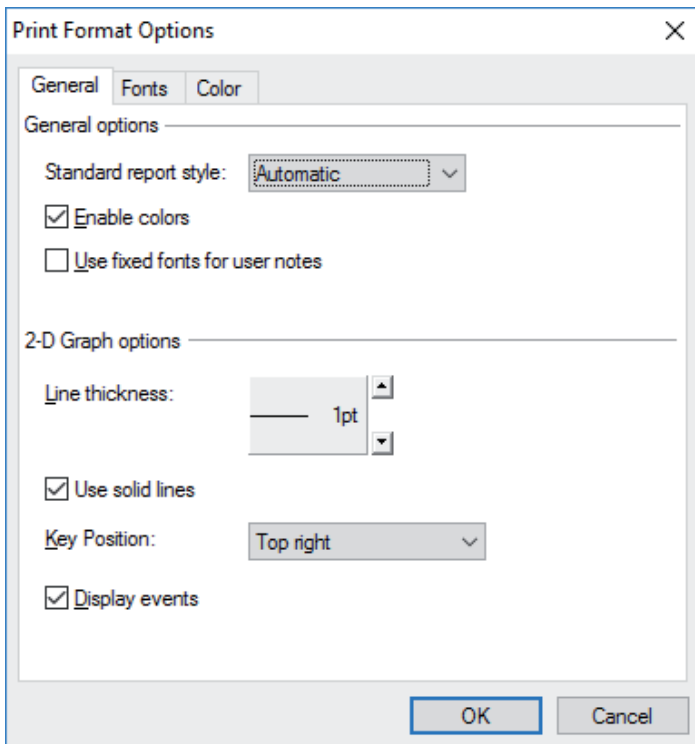

From the Print Preview dialog select the Print format setup

Screen 28.

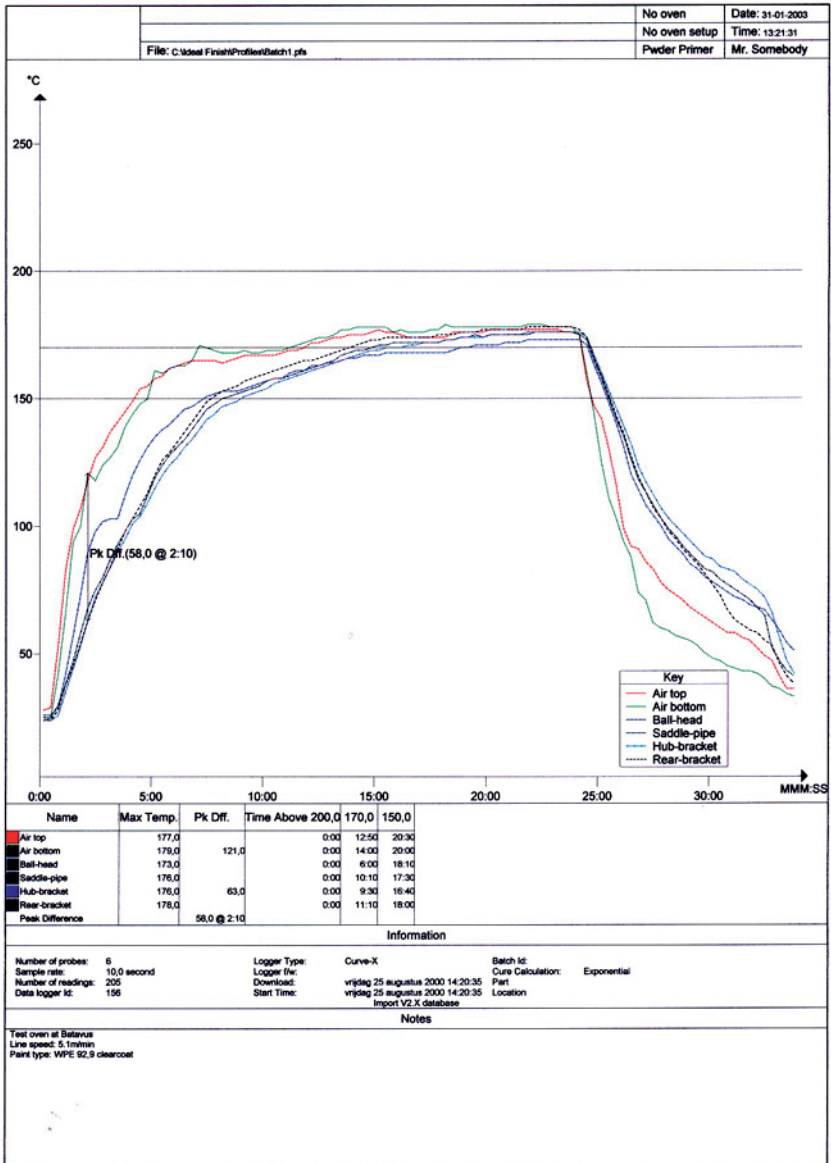

Use the format setup options to tailor printed report properties to your needs.

Screen 29

## 4.5 Basic report

## 5 TQC SHEEN IDEAL FINISH ANALYSIS – ADVANCED MODE

---

The advanced mode in TQC Sheen Ideal Finish Analysis provides users with a tool for customizing the reports generated by the software. Details such as the type and size of the oven, the position of the probes and the shape of the product, paint specifications, calculation styles, etc. can all be integrated into the report. This allows users to refine the style of reports to meet their own requirements.

Switch to the advance mode by choosing System Configuration from the Tools menu. The Advanced mode of this software is separate from the Basic mode. Users of the advanced mode are considered to have a basic knowledge of Windows®-operated programs. As the TQC Sheen Ideal Finish Analysis software follows the Windows® style, this manual does not explain each step to be taken to change specific settings. Instead, it focuses on the actual functions and their options and the role they play in the entire software concept.

Users can use TQC Sheen Ideal Finish Analysis to view and interpret profile data in the following way:

- Data tabs:  
as calculation or data results in columns.
- Graph bar:  
as data results in several graphs.

The various settings for data and graphical calculations are explained in Sections 5.1 and 5.2.

### 5.1 Data tabs

On the data tabs, various calculations and settings can be applied to the downloaded data. Besides the data tabs in basic mode, data can be viewed in columns, oven settings can be applied, probe properties can be modified, and reference curves can be used to compare previous measurements with current measurements.

#### 5.1.1 Results

In Advanced mode, result columns can be added, modified or deleted from the Results tab sheet as desired. To do this, click the column header with the right-hand mouse button to display a shortcut menu that you can use to change the column properties. The possible calculations are explained in the next chapters. Please note that these calculations are applied to the profiles and not to the paint type. The paint type may be used as input parameters (e.g. cure value).

Most of these calculations can be considered to be over a region of the profile - for example, the whole profile or the current zoom or a specific zone. The software can therefore be configured to display the result over the specified area - for example, Max. temperature over the whole profile or just the current zoom, and so on....

#### **5.1.1.1 Max. temperature**

Calculates the maximum temperature, which is useful to ensure that the product is at the right temperature. This is the maximum temperature that a specific profile has reached, so if the maximum temperature for probe1 equals 205 that means that the profile reached 205.

#### **5.1.1.2 Time of Max. temperature**

Calculates the time that the temperature has been at a certain maximum.

#### **5.1.1.3 Min. temperature**

The minimum temperature is really only useful if oven zones have been defined. Then it is possible to make sure that the product has reached the correct temperature while entering or leaving a zone.

#### **5.1.1.4 Time of min. temperature**

Calculates the time that the temperature has been at a certain minimum.

#### **5.1.1.5 Average temperature**

Calculates an average probe temperature within a zone. The option can be used to make sure the product has been exposed to a reasonable temperature within the zone.

#### **5.1.1.6 Largest rate of rising temperature**

Calculates the moment at which the temperature rises the fastest. This is useful to ensure that the product has not been heated too quickly. (an "orange peel" effect can sometimes occur).

#### **5.1.1.7 Time of largest rate of rising temperature**

Calculates the range of time during which the temperature increase is the fastest.

#### **5.1.1.8 Largest rate of falling temperature**

Calculates the moment at which the temperature falls the fastest. This is useful to ensure that the product does not cool too quickly.

#### **5.1.1.9 Time of largest rate of falling temperature**

Calculates the range of time during which the temperature drop is the fastest.

#### **5.1.1.10 Peak difference**

Calculates the balance of heating over all probes. This is useful to ensure that the product was evenly cooked all over (curing conditions should have the right temperature for the correct melting and cross-linking of the powder).

#### **5.1.1.11 Time above**

Calculates the time this particular probe measured a temperature higher than the temperature specified. (Note the extra time field is used to allow the text to turn red if it has not received the correct level of time.)

#### **5.1.1.12 Rising time between temperatures**

Calculates the rate of temperature rise within a certain period. This is useful to ensure that the product is not heated up in too short a time (as this could prevent the mechanical transformation of the product).

#### **5.1.1.13 Falling time between temperatures**

Calculates the rate of temperature fall within a certain period. This is useful to ensure that the product is not cooled down in too short a time (as this could prevent the mechanical transformation of the product).

#### **5.1.1.14 Time between temperatures**

Calculates the time span defined between the lower and upper temperature.

#### **5.1.1.15 Cure**

Calculates the cure level, a number based on the summation of the cure below the cure parameter values. This is a useful number when comparing cures or when decreasing the time-temperature values to an optimum at which the cure remains sufficient.

#### **5.1.1.16 Time rising temperature reached**

Calculates the first time that the specified temperature occurred on the rising temperature slope. The sampling starts from the beginning of the profile and checks the first time the profile exceeds the specified temp.

#### **5.1.1.17 Time falling temperature reached**

Calculates the last time the specified temperature occurred on the falling temperature slope. The sampling starts from the end of the profile and looks backwards to find out the first time the profile exceeded the specified temp.

#### **5.1.1.18 Time above excluding**

Calculates the Time above but excludes temperature values. This is useful when comparing calculations on profiles with the EasySoft / AOLS program.

### **5.1.2 Notes**

Use this option to add additional information for the current profile.

### **5.1.3 Details**

Use this option to add customer or owner information.

### **5.1.4 Data**

On this tab, the data can be analyzed in columns. Each logging is shown in a row of data for each probe. Use the UP/DOWN arrows and the PAGE UP/DOWN, HOME and END keys to scroll through the data. A vertical marking line in the graph follows the scrolling movement.

### 5.1.5 Oven start

Use this option to define the moment the logger entered the oven, manually or automatically. It activates an automatic search for the first moment of temperature rise in the profile.

### 5.1.6 Events

When tolerance bands are used, events are generated automatically if the profile values are outside the tolerance band region. For each event, the Start time, the Stop time, the event Id and the event Description is logged.

### 5.1.7 Probe position

For each probe, some of the properties can be modified here. All changes apply immediately in the probe layout files.

### 5.1.8 2D Overlay

Select the overlay file or graphical cure with which to compare the current profile data.

## 5.2 Graph bar

In order to visualize the measured data, the TQC Sheen Ideal Finish Analysis program has been downloaded from the logger.

### 5.2.1 Graph options

For the 2D, 3D and Time above graphs, the Graph Options icon is active. Line styles, colors, thickness, limits and fill colors can be customized in this section. In basic mode, only the 2D graph is available.

### 5.2.2 Two dimensional graph

Click on the 2D icon to view the data in a two-dimensional graph. Define the graph options as desired and define measurement points by clicking the left-hand mouse button in the graph at the positions where you would like more detailed information. Remove measurement points by clicking the right-hand mouse button on the spot. To compare the graphical cure with the current profile, define the option 'Overlay Graphical Cure' in the 2D overlay tab of the data tabs.

### 5.2.3 Time Above constraints

Click on the Time Above icon to view the constraint data in a two-dimensional graph.

### 5.2.4 Graphical Cure

Graphical Cure displays the cure number in time. This graph is very useful for determining the time at which a cure of 100 was achieved on all probes. A cure of 100 is the optimum time-temperature value for this particular product.

### 5.2.5 Three dimensional surface graph

The most extensive view of profile data is displayed in a three dimensional surface graph. In this graph, all probe data is linked to simulate the cooking of the object surface at any point in time. If an oven has been linked, the oven zones can also be displayed in customized colors. Define the graph options for various displays and an easy analysis of the entire cooking process.

**Example:**

Assuming that line speed, etc. has been entered, the probes are offset along the probe line according to the probe leading edge. The probes will also exhibit lag according to their position in the direction of flow. This should mean that the 3D graph is a reasonable representation of how the temperature is flowing from the perspective of the oven. This is the reason why the 3D graph can be viewed in zones.

**5.2.6 2D graph zoom**

There are many methods that can be used to define the zoom for a graph:

**Zoom by keyboard:**

- Alt+1 means zoom to zone 1, Alt+2 means zoom to zone 2, etc. up to Alt+0, zoom to zone 10.
- You can use the Tab key to switch between the different zones.

**Zoom by mouse:**

- Click and hold down the right-hand mouse button to display the pop-up zoom menu.
- Zoom in by selecting an area on the 2D Graph.
- Switch back to full zoom by clicking once with the right-hand mouse button.
- Zoom in the Graphical Overview window:
  - Choose Graphical Overview from the View menu. This feature is also available in the Print-Preview menu.

The overview window displays the full graph, with a shaded edge box displaying the current zoom. This box is called the “zoom tracker”. The zoom tracker has handles at the edges and corners. Move and re-size the zoom tracker using the mouse. Move the mouse over the zoom tracker and see how it changes when positioned over the handles. Drag these handles to change the zoom, or drag the entire zoom tracker from the Graphical Overview toolbar.

**5.2.7 3D graph zoom****Zoom by keyboard:**

- Press the + and - keys to zoom in and out
- Press the LEFT/RIGHT arrow keys to rotate clockwise and counterclockwise (hold down the SHIFT key for more refined control)
- Press the UP/DOWN arrow keys to view the graph from above or below, and press CTRL and UP/DOWN arrow keys to move the graph up and down.
- Press the HOME/END keys to view the graph in the default position from the front or back

**6 ADVANCED SETUP**

---

In the Advanced mode, there are several extra options in the Shortcuts menu.

**6.1 Ovens**

You can use this option to specify one or more ovens. The measured data will be displayed with

the specified oven in the background. Especially for larger ovens, this clearly visualizes the position in the oven of possible spikes or other irregularities in the temperature graph. An unlimited number of ovens can be created; this is quite convenient for users who visit many different facilities.

The following details can be defined for each oven:

### **6.1.1 General**

On this tab, the physical structure of the oven is specified. The Control option is used to define the maximum number of controls for each zone. A control could involve a thermostat, an air valve, or a ventilator switch, etc. By documenting the settings, the specific setup of the oven is recorded.

### **6.1.2 Zone details**

Specific details can be defined for each zone.

### **6.1.3 Control details**

Each control can be specified here.

### **6.1.4 Controls available**

For each zone, you can specify which controls are available. For example, an air curtain is often found at the "entry zone" (on/off switch in zone 1) but not in further zones.

### **6.1.5 Description**

Here you can enter a description of the oven for further identification.

## **6.2 Oven set up**

An oven can be defined in different ways in order to suit various production processes.

### **6.2.1 General**

Here you can define the units and other general settings for this option.

### **6.2.2 Line speed**

Here you can define the speed of the conveyor. (Line speed affects calculations of the probe lag option as described in the chapter on Probe Layout.)

### **6.2.3 Control settings**

Here you can record the setting of each control for each zone.

### **6.2.4 Description**

Here there is space to include specific information about the setup, which makes it easier to identify the setup later.

## **6.3 Probe Layout**

The Probe Layout option enables you to define default probe positions on the cure object. This is

very useful when focusing on the probe settings for each individual product, many of which are processed frequently but are not necessarily the only products. Once a probe layout has been created and / or selected, the following properties can be defined.

### **6.3.1 General**

Define the number of probes for the current probe layout. The “Auto generate probe lags” setting enables the program to synchronize the oven time/distance lag with the product. This is very useful when viewing the profile of a large product because the first probe will enter the oven a lot earlier than the last probe. When you define the “Auto generate probe lags” option, you can also define the direction of flow of the product, which is then important.

### **6.3.2 Image**

Use the product image to get a good impression of the probe positions. The image size and orientation are defined to reflect reality as much as possible. These measures will be used when calculating the probe lags.

### **6.3.3 Details**

In this section, you can define extra details (probe properties for each individual probe). The probe position is easy to move with a mouse; just click the probe in the image area and drag it into position. Note that when “Auto generate probe lag” is selected on the General tab, the Lag text box is disabled for data entry. Disable the “Auto generate probe lag” option and define a custom probe lag here. When you select the air probe check box, you exclude the probe data to be used when calculating the peak difference.

### **6.3.4 Colors**

Here you can change the probe colors. Colors will appear on a printed or mailed report in the way they are defined in this section.

### **6.3.5 Gridlines**

Use this option to enable or disable the horizontal and vertical gridlines on this tab sheet. You can also customize the gridline color and/or style.

## **6.4 Paint types**

This option is used to manage the library with different paint types, together with their cure specifications and, if required, several extra constraints.

### **6.4.1 General**

In this section, the general settings of the paint are defined, such as the number of cure characteristics (time-temp pairs), number of constraints, and other settings.

### **6.4.2 Cure Parameters**

Here you can program the paint cooking schedule provided by the paint manufacturer.

### **6.4.3 Constraints**

This option has been developed for professional users who are interested in optimizing the

efficiency of their total production process. By defining several constraints, users can create a “region of acceptability” or “cure window”.

The smaller this cure window, the more efficient the production process will be. It is assumed that users will probably refine the cure window over time using their experiences with earlier tests.

Typical constraints include the minimum and maximum temperature and times of a powder coating but other constraints may also be taken into consideration.

#### **Example 1.**

A paint type has a maximum application temperature of 250°C. However, the parts that are being coated may not exceed 200°C because of mechanical properties (e.g. stress). This user will add a maximum temperature constraint at 200°C although the paint specification specifies a different temperature.

#### **Example 2.**

On an assembly line (for example, a car manufacturer), the coating process and curing oven is just one of the many processes. If all processes do not need more than 14 minutes, for example, it is desirable to create a cure process that does not take longer than 14 minutes. In this case a constraint would be set at 14 minutes.

#### **Example 3.**

The maximum line speed of the conveyer belt is 15 feet / minute. Knowing the oven temperature, oven length and object mass, the line speed could be a constraint to take into account.

### **6.4.3.1 Hatching**

Those parts that are outside the cure window should be hatched. In sample 1 above, the part “greater than” the line at 200°C should be hatched.

### **6.4.3.2 How to judge the “Time Above” graph**

All the lines in the graph should cross the cure window. It is sufficient if they just cut the corner.

## **6.5 Tolerance Bands**

Using tolerance bands, it is possible to define a region in which the profiling will fit. You do this prior to the measurement using various data such as paint curing information, material stress, oven heating capacity and other possible variables. A tolerance band predefines the curing process bandwidth. Tolerance bands can be set as overlay in the profile 2D overlay tab. If values are outside the tolerance band region, events are generated automatically on the Events tab.

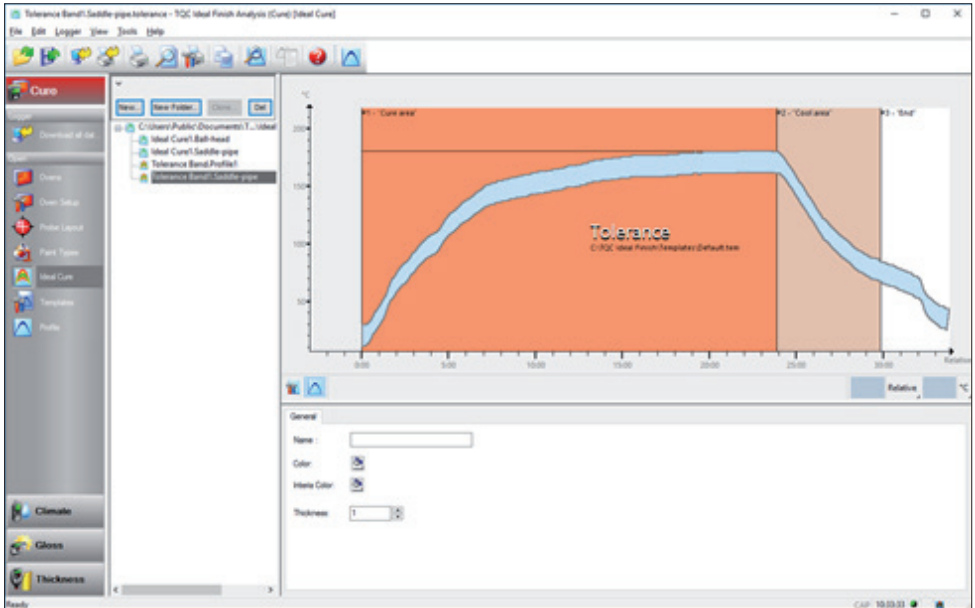

### **6.5.1 General**

In this section, you define the general settings of the tolerance bands.

### 6.5.2 Phases

Build the tolerance band in this section by defining the number of phases and the duration, starting point and end point of each phase.

Screen 30.

### 6.6 Ideal Cure

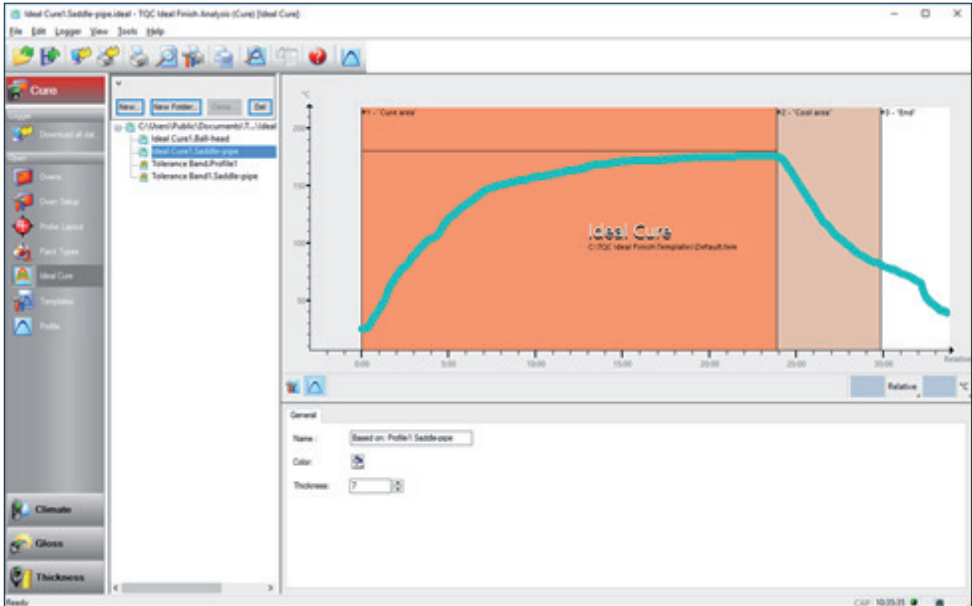

Ideal cures are all ideal process variables together. Once the profiling has been performed under ideal circumstances, it can be saved as an ideal cure and defined as overlay on the profile 2D overlay tab for future analysis of the ongoing processes.

Ideal cures are generated over a single probe, multiple probes, the average or peak difference of a single probe, or all probes.

## 6.6.1 General

Define the general preferences for the ideal cure.

Screen 31.

## 6.7 File - Save As Special

The File menu contains five advanced options under Save As Special.

### 6.7.1 Save As HTML

Use this option to save any of your profiles in HTML format.

### 6.7.2 Save Zoom As

Use this option to save a selected area of your profile to a new profile. You can save only the interesting area of a profile, or save a multiple profile run (using the 1 big log block) into individual profiles.

### 6.7.3 Save As Tolerance Band

Use this option to create a tolerance band based on a profile. The tolerance band can be based on a single probe, multiple probes, the average or peak difference of a single probe, or all probes. Tolerance bands can be defined as overlay in the 2D profile overlay tab.

- Specify the upper and lower limit to define the bandwidth of the tolerance band.
- Use Filter Rolling Average to reduce noise on the tolerance band.

- **NUMBER OF POINTS** is the value for points in the tolerance band. The original profile is made up of many points, normally around 500 (depending on the sample rate and run length). The tolerance band will tend to be a smaller number of points, which will be drawn faster on the screen.

#### **6.7.4 Save As Ideal Cure**

Use this option to save your optimum process variables in a new curve. Ideal cures are generated over a single probe, multiple probes, the average or peak difference of a single probe, or all probes. Once saved as the ideal cure, the graph can be overlaid in the profile 2D overlay tab for future analysis of the ongoing processes.

#### **6.7.5 Save As Reference File**

Use this option to make a copy of a profile and save it in the reference file folder of TQC Sheen Ideal Finish Analysis. Reference files can be overlaid in the profile 2D overlay tab for future analysis of the ongoing processes.

### **6.8 Templates**

Templates are the most convenient way of combining the settings of an oven, a probe layout and a paint type in one setup file. Even customized calculation columns or graphical overlays can be preset in a template. Once the template has been created, this particular setup can be used again at any time when the same product or situation occurs on the production line.

One special template is called `Default.tem`, which is located in the Templates directory in TQC Sheen Ideal Finish Analysis. The template may be modified as desired but may never be deleted, as it is the default template on which all settings in basic mode are based.

#### **6.8.1 Links**

Use this option to specify the link between the various settings. In the first section, select the oven with the corresponding oven setup. If several oven configurations have been created for this oven, select the desired configuration here. An automatic oven start will search for the first rise in temperature in the profile linked to this template. In the second and third sections, you can define the setting of the probe layout and the paint type.

#### **6.8.2 Overlay**

In this section, previous profiles and graphical cure can be defined as references for future measurements. For an overlay of the graphical cure, check the check box. The profiles to refer to during any future measurement can be added in the Files box. See the Run chapter earlier in this manual for the exact meaning of these functions.

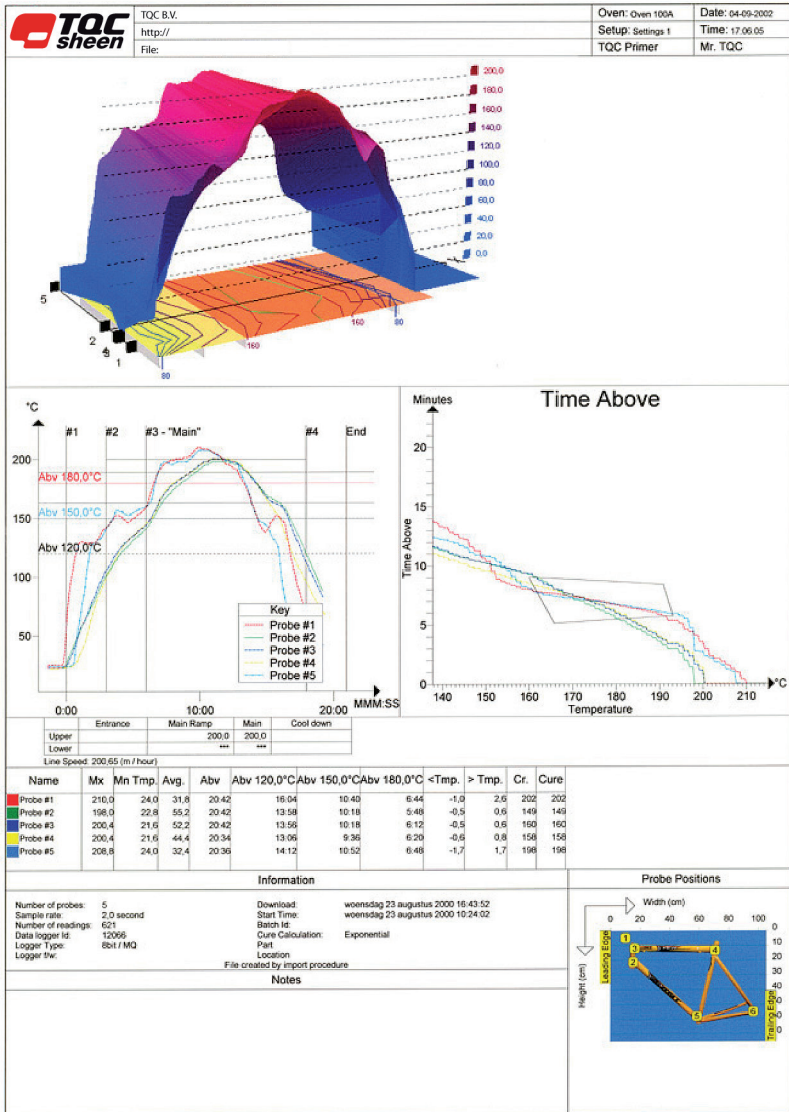

#### **6.8.3 Results**

Use this option to add the Results columns, which should be displayed on the screen and in reports. These settings will be used as default column settings for future measurements. Each column can be customized according to your preferred settings. See the Run chapter earlier in this manual for the exact meaning of these functions.

## 6.8.4 Notes

Use this option to add any extra template information.

## 6.9 Advanced report

## 7 ADDITIONAL FEATURES

---

### 7.1 Options

A number of other options for customization are located under Options from the Tools menu.

#### 7.1.1 View

Use this option to define extra options, such as displaying short cuts. You can change the default settings for the optimum configuration.

Show shortcut keys: Display the shortcut keys in the tool tips, menus and/or toolbars.

Show toolbar images: Display menu images in color and/or display the TQC Sheen Ideal Finish Analysis logo.

Hot key look: A pop-up control menu is displayed when the mouse moves over the control.

#### 7.1.2 General

Animated zooms: uncheck when the PC is low on resources (graph overview, changes of zooms will not be displayed in real time!).

Reload document: when enabled, the software loads the last viewed document at the next start-up.

Save images as JPEG's: This option is used when sending emails or saving as HTML. The graph is stored in JPEG format (this is the default format).

Compression level: Only supported by Windows 2000 and Windows XP; higher compression reduces the size but also the quality.

#### 7.1.3 File locations

Define the path to the various TQC Sheen Ideal Finish Analysis files. In a network situation, the system administrator would normally define the path for these files to the network file server. This would then enable the files to be dealt with centrally - for example, standard oven definitions.

#### 7.1.4 Colors

Define custom colors here as desired. A list of ten custom fields can be added to the system configuration.

#### 7.1.5 Macro Security

Define the macro security level on this tab. In TQC Sheen Ideal Finish Analysis, you can run macros written in Visual Basic. Sample files are located in the Software Development Kit (SDK) folder C:\Program Files(x86)\TQC\TQC Ideal Finish Analysis V4\SDK.
